SINCE AI HACKATHON 2026 · BAYER CHALLENGE

Reuse Gate

Build less, build better: check what exists before anyone builds a new dashboard.

Team ZtotheZ · Roosa Yöruusu · Runs on Red Hat OpenShift AI

THE PROBLEM

Every new question becomes a new dashboard

360
reports in the estate

206
unused or marked for retirement

86
without an active owner

13
KPIs with conflicting definitions

Self-service BI is fast, but nobody checks what already exists. The result is sprawl, duplicate logic, unclear ownership and a maintenance bill that grows with every request.

Source: Bayer's synthetic Builder Data Pack (Analytics_Assets, KPI_Catalog, Owners).

THE SOLUTION

A gate before the build, with a person in charge

Prompt
plain words, or voice

→

Clarify
at most 3 rounds; rules pick the questions

→

Evidence
every report in scope, cited rows

→

Decision
reuse, repair, extend, migrate, retire, build

→

Gates
7 checks block release

→

Approve
owner and review date

Rules decide. Deterministic, cited, repeatable and auditable. If every model is down, the decisions stay the same.

AI reads and words. It reads messy requests, phrases questions and explanations, and answers in a request's chat. A faithfulness guard drops any claim not in the decision.

Mapped to Bayer's flow: Prompt-to-Intent, Intent-to-Evidence, Evidence-to-Spec, Spec-to-Report

DEMO

One request, one clear answer

Business user asks

"Create a global Nubeqa dashboard showing sales growth, forecast variance and market access by country."

EXTEND AN EXISTING REPORT

Nubeqa Gross-to-Net Monthly

Covers 2 of 3 requested KPIs as primary. Forecast Variance needs adding. Don't build a new one.

8 → 20

of 21 messy prompts understood: at first, then after the clarification loop

1,098

citations across 150 requests, every one exists (validity 1.0)

Analysts see every cited row; the business user sees one card and can listen to it

GOVERNANCE

Nothing is released until it is owned

GATES

5 → 7

of 7 gates pass after the approver simulates one active owner for an oncology build. The record keeps both.

ESTATE

13 → 93

of 124 specs would pass after one owner fix on a shared semantic model (modelled).

CONFIGURATION

57 → 51

avoided builds if "unused" meant below 300 views: measured on all 150 requests before an approver decides. Nobody approves their own change.

LEAST PRIVILEGE

Everyone gets their own app, and only their own data

Business	Asks, gets one plain answer with audio; sees only their own requests
Analyst	Cited evidence; dashboard studio fills a request's spec with real rows (render_preview), drag and drop, export
Developer	Proposes rule and vocabulary changes, each measured on 150 requests
Approver	Gates, what-if owner fix, approval with owner and review date
Executive	One-page report in plain words, a source under every section; print or email
Operator	Wall screen for gloves and distance: what is broken now and who to call
Admin	Workflows and email through n8n, with an outbox of every message

Enforced by the API on every endpoint, not hidden in the UI. Approver names are hidden from those who do not decide.

BUSINESS IMPACT

38% fewer dashboards to build and maintain

57 / 150

requests avoid a new build: reuse, repair, extend or migrate instead

451

reports in the estate with the gate, against 510 without it, after the same 150 requests

80

more specs unblocked by one owner fix

Fewer reports to refresh, certify and support; one definition per KPI; every asset with an owner and a review date.

Modelled on Bayer's synthetic data pack, assuming each recommendation is approved; not measured savings. Method and caveats are on the Evaluation page.

RED HAT OPENSHIFT AI

Served, gated and observable on OpenShift AI

Web app

React UI, one app per role. Sign-in by role code; the top bar shows where each decision ran.

Reuse Gate API

Python, non-root, read-only container, state volume. Least privilege on every endpoint. Falls back to in-pod rules and says so.

KServe InferenceService

The decision service as a served model on its own ServingRuntime, listed in the OpenShift AI dashboard.

OpenShift Pipelines

Tekton run before every rollout: unit tests, governance gate, evaluation gate, security gate, rollout.

Model tiers

gpt-oss-120b, then GLM-5.2, then rules, with a circuit breaker. Models read and word; they never decide.

n8n and ElevenLabs

Email for approvers, requesters and developers; a weekday radar digest; Listen in plain language.

380 backend and 187 front-end tests. Live: reuse-gate-ui-ztothez-dev.apps.rm1.0a51.p1.openshiftapps.com

WHAT'S NEXT

From hackathon to a pilot in one division

- Single sign-on instead of role codes (one function changes)
- Power BI or Fabric metadata scanner in place of the data pack
- Approval rights by domain; tamper-evident decision log
- .pbip export from the dashboard studio

- 8-week pilot with one analytics team
- Measure real avoided builds, time to answer, owner coverage
- Go or no-go on agreed thresholds
- See the pilot plan in the submission

Build less. Build better. With a person in charge.
